Answered Problem Sections: 4/5

Kaleb found 6 clusters and compared how common each one is between dropoff and retained shows, which is exactly what my proposal asked for. But only really cluster 0 (voice acting/dub complaints) came out as something specific enough to actually act on. The other clusters, especially cluster 1 and cluster 5, ended up being more like general genre language than real complaint themes, so it doesn't fully hit the "4 to 8 clear themes" part of my success criteria.

Technique judgment: 5/5

He explained clearly why this had to be unsupervised, going back to the part of my proposal that said not to use a pre made list of complaint categories, and TF-IDF plus K-means makes sense for finding themes in text without labels. He also noticed a problem where clusters were forming around franchise names instead of themes, and fixed it by filtering out words that don't show up across multiple shows, which I think was a good catch.

Evaluation/interpretation quality: 5/5

He reported the silhouette score (0.009, which is low) and was honest that it means the clusters overlap a lot instead of being clean. He tied the results back to my success criteria by pointing out which clusters could actually help with things like localization or marketing decisions, and even tried a second pass of clustering on cluster 5 to see if it would split into anything more specific, which it didn't. I think this shows he actually tried to connect the numbers back to what I asked for instead of just reporting a score.

Communication: 5/5

The executive summary is written in plain language and someone non technical could follow it. Also he was fast communicator on discord.

Open-ended feedback (paragraph):

Overall I think Kaleb did a solid job here. He fixed the two data problems I flagged in my proposal (the CSV parsing issue and the movies vs series mixup) and was honest the whole way through about what worked and what didn't, instead of overselling weak results. The main gap is that most of the other clusters ended up being genre language rather than real complaint themes, so if I were actually using this at AniStream, I'd probably ask for another pass with more complaint specific keywords, which he actually already suggested himself in the Limitations section. I appreciated that he flagged this himself instead of me having to point it out.
